AUTHOR: Indreas, Grigore (Engineer, Candidate of technical sciences, Scientific researcher)(Bucharest); Ryltsev, P. I. (Physicist, Scientific researcher)(Dubna)

TITLE: Determining the position of the median surface in electromagnets with axial symmetry 21

SOURCE: Electrotehnica, no. 9, 1964, 317-320

TOPIC TAGS: electromagnet, axially symmetric body

ABSTRACT: (Author's English summary modified): The authors describe several common methods and devices used to determine the position of the magnetic median of electromagnets with axial symmetry, with special emphasis on a simple method which makes use of the Hall effect. Orig. art. has 3 figures and 3 formulas.

TITLE: Use of a plasma gun for producing high electron-current peaks

21, 44, 5
56
55
B

SOURCE: Pribory i tekhnika eksperimenta, no. 1, 1966, 139-143

TOPIC TAGS: plasma gun, pulse shape

ABSTRACT: A new plasma-gun¹⁴ electron source (see figure) consists of three electrodes: discharge electrode 1, diaphragm 5, and extraction electrode 6 mounted on two stainless-steel disks. Plexiglas¹⁴ bushing 4 (active material) is fed by spring 8 toward the gap as the bushing end is burned up. The discharge electrode is insulated by porcelain bushing 3. The tungsten diaphragm has a 1-mm port. Insulated cathode 2 is intended for improving the extraction conditions and focusing; its insulation is designed to withstand a working voltage of 30 kv. The

plasma-gun electron source

Card 1/2

ACC NR: AP6007826

stainless-steel cylindrical extraction electrode is grounded. When a +17-kv "trig-
atron" pulse is applied to the discharge electrode, a spark to the diaphragm
evaporates some of the plexiglass and forms a plasma in chamber 7. An electric field
extracts electrons from the plasma. An electron current of 200 amp was produced in
0.15-0.2-msec peaks when a constant d-c voltage was used for extraction. With a
pulse extraction voltage (provided by a capacitor), an electron-current peak of 1 ka
 10^{-6} sec has become possible. "In conclusion, the authors wish to thank P. F.
Chernyayev for his great contribution to the construction of the experimental outfit."

TITLE: Some problems in the compilation of a composite small-scale map of the USSR's magnetic anomalies (Discourse theses)

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 7, 1962, 30, abstract 7A199 (V sb. Sostoyaniye i perspektivy razvitiya geofiz. metodov poiskov i razvedki polezn. iskopayemykh, M., Gostoptekhizdat, 1961, 516)

TEXT: Defects in the method of regional surveys were ascertained when compiling a composite magnetic anomaly map on a scale of 1:1,000,000 for the eastern half of the USSR's European part. Recommendations are given for the method of surveys, their tying in to absolute values, and for the preparation of composite maps. It is expedient to create an All-Union reference aeromagnetic network. ✓

Changes in coloring of the wings of *Lymantria dispar* by the method of Zaczalichowski. J. Rymat. (Jagellonian Univ., Crakow). *Bull. intern. Acad. polon. sci., Classe sci. math. nat.* 1946, III, 261-8. - Pupae of *Lymantria dispar* (I) and *Vanessa urticae* (II) were injected, just after pupation, with various preps. With mixes. of phenolic bodies and peroxidase little change was observed in II, but in I females, the normally light ground wing color darkened whereas, in I males, the dark color of the wings was lighter. In contrast, when an oxidized collect. was injected, a marked wing color change was observed in II but not in I. The sex differences observed prove that the hydroxyaromatic compds. did not act as propigments but rather caused disturbances in pigment production.

RYMAR, J.

✓ 2483. New experimental modifications of *Phytometra gamma* Haw. obtained by the application of chemical factors. J. Rymar *Folia Biol. Warsaw*, 1955, 3, 41-54. Modifications of the wing pattern in *P. gamma* Haw. (*Noctuidae*) are described which were obtained by intrapupal injections of raw coffee bean ("Santos") aq. extract enzymically oxidised with horse radish (*Cochlearia armoracia*) peroxidase in a 3% H₂O₂ soln. The age of injected pupae ranged from 3-20 hr. The 4 wing patterns observed are arranged by differences in the degree of change of the gamma sign and the rest of the wing pattern. The chemical factor applied in the form of intrapupal injections interferes with the developmental processes of the scale-producing cells in the early stages of pupal life, most probably through changes in the metabolism of poly-oxyphenolic compounds in the haemolymph of the pupa. B. VINRY.

C#

A new group of organic compounds which on injection modify the wing pattern of Lepidoptera. J. Rymar, *Bull. intern. acad. polon. sci., Classe sci. math. et nat.* 1047, III, 317-09 (in French). The origin of the wing patterns of Lepidoptera is attributed to tyrosinase acting on tyrosine to form melanin or other enzymes known collectively as chromooxidases. High and low temps. acting for 48 hrs. on the pupae of Lepidoptera also strongly modify the wing pattern, producing, in general, forms much richer in melanin. Zaćwilichowski (*Pam. XIV. Zjazd Przem. i Lek. Pol. w Poznaniu*, T. I (1933); C.A. 31, 87149) obtained varieties of Lepidoptera identical with those produced by high and low temps. by injecting phosphotungstic and phosphomolybdic acids into the newly formed pupae. R's studies involved injection of solns. of various substances into pupae of *Laeonere arctone*, at 24° of pupal age. Pupae of other sp. (*Laeonere* sp., *L. polyphora*, *L. ulianka*, *Polyommatus caeruleus*, *Phylometra gamma*) were used in some expts. The pupae were usually injected 12-18 hrs. after transformation from the larvae. One % solns. of pyrogallol, pyrocatechol, protocatechuic acid, caffeic acid, gallic acid, and tannin were injected as such; the hydroxybenzene compds. cited, after mixing with 1% FeCl₃ soln. to produce colored compds., were also injected. The same compds. oxidized by contact with air of their 1 to 2% or of their satd. solns. contg. 1 part NH₄OH to 3 parts soln., were likewise in-

jected. In other expts., the polyphenols were oxidized in oxygenated H₂O by peroxidase extd. from radish root, and in others, exts. of red rose petals and of unroasted coffee grains, reacted with radish peroxidase in oxygenated H₂O. Expts. were also made with methylene blue and cochenin (Grübler); others with 1% solns. of HCl, H₂SO₄, H₃PO₄, HNO₃, and sulfosalicylic, uric, taurocholic, glycocholic, and nucleic acids, and with various amino acids, alkaloids, enzymes, adrenaline, etc. Only the colored substances obtained by oxidation of the hydroxy aromatic compds. produced variations of wing pattern. These variations do not differ from those produced by injection of phosphotungstic and phosphomolybdic acids. On the other hand, high and low temps. produce varieties which show a quasi-identical resemblance to those obtained by injection. Some of the compds. injected are known to ppt. the hemolymph, others do not; pptn. of the proteins of the hemolymph does not provoke variations in the wing patterns. The effect of chem. and phys. agents is not solely an increase in melanin but rather a disturbance of the localization of the dark- and light-colored wing scales. The various patterns produced by these agents are described. Either the agents damage the mechanism of the wing buds so that the design of the pattern is reproduced in a simplified manner, or the wing buds have the power to form designs; a power ordinarily not realized but which is brought into action by certain chem. agents and by heat and cold. TITLE: Lecture-Propaganda

PERIODICAL: Professional'no-tekhnicheskoye obrazovaniye, 1958, Nr 9,
pp 26 - 27 (USSR)

ABSTRACT: Together with professional training of young students of
the building trade, the general educational level is being
raised by lectures and discussions. Frequently, guests
from other schools are asked to hold lectures, whereby the
various themes are also prepared by the students of this
school. The author mentions some of the themes which do
not pertain to professional training, such as "The Youth
of the World Stands For Peace" and other ideological pro-
paganda. Experience has shown that well conducted lecture-
propaganda at schools can be considered as a valuable
means for strengthening communist ideology.

The O_2 absorption was measured by the Carthesian diver technique at a temperature of $39.5^\circ C$. It was found that in spite of morphological and biological similarities of both tumours, the carcinoma cells absorb 1.6 times more O_2 than the sarcoma cells. After several hours of exposing the neoplastic exudate to a temperature of about $+4^\circ C$, the cells of both kinds of tumour use a great deal more O_2 .

TITLE: Gas laser generation power in nearly confocal resonators

SOURCE: Optika i spektroskopiya, v. 21, no. 2; 1966, 258-260

TOPIC TAGS: gas laser, neon helium laser, infrared laser, LASER ENERGY, NEON, HELIUM

ABSTRACT: A qualitative explanation of the mechanism responsible for the appearance of the maximum of power generation in a nearly confocal resonator of a gas laser is offered. The generation of a neon-helium laser at $\lambda = 0.63$ and 1.15μ was studied. It is shown that because of a decrease in the figure of merit in the region of instability of the generation, a minimum should appear on the curve representing the generation power as a function of L (L being the distance between the mirrors). The width of the minimum is equal to the width of the instability region traversed, and is determined by the difference in the mirror radii ΔR . In a study of a resonator with mirrors whose radii $R_1 = R_2 = 250$ cm within 0.4 cm, minima were obtained whose width was greater than 0.4 cm and was varied by shifting the discharge tube along the resonator axis and replacing the tube by another. These experimental data were attributed to the distorting influence of the exit windows of the discharge tube. It is shown

2

that a tube window built with an error of $\sim \frac{\lambda}{2}$ and consisting of a lens with a focal length of 100 m causes the appearance of a region of instability of width $\Delta L = 6$ cm at $R = 250$ cm. The region of instability was found in similar fashion for a resonator where the space between one of the mirrors and the window is filled with a gas with refractive index N_1 different from the refractive index of air, N_2 . In this case, $L = \frac{N_1 - N_2}{N_1} R$. These calculations were confirmed in a series of experiments. Authors are grateful to E. Ye. Fradkin for his discussion and to A. N. Razumovskiy for his assistance in the experiment. Orig. art. has: 2 figures and 1 formula. [27]

Rymarenko, B. A. On polynomials which are monotonic on the whole real axis. Doklady Akad. Nauk SSSR (N.S.) 71, 1029-1032 (1950). (Russian)

The author states without proof the solutions of the problems of finding the smallest variation on $[-1, 1]$, and the minimizing polynomial, for polynomials of odd degree n which are monotone increasing on the whole real axis and for which either (1) the coefficients of x^n, x^{n-1}, x^{n-2} are given; (2) the coefficient of x^n and the derivative at a prescribed point are given; or (3) the first two derivatives are given at 1. The solutions are too complicated to reproduce here.

Rymarenko, B. A. On the least deviation from zero of a cyclically monotonic polynomial with its two highest coefficients given. Doklady Akad. Nauk SSSR (N.S.) 83, 179-182 (1952). (Russian)

The author solves the following extremal problem: to find, among all polynomials of the form $x^m - ax^{m-1} + \dots$, which are cyclically monotonic of degree p on $(0, 1)$, $p \leq m-2$, those deviating least from zero, and the value of the deviation. (A function $f(x)$ is cyclically monotonic of degree p if $f^{(k)}(x)f^{(k+p)}(x) \leq 0$ for $0 \leq k \leq m-2$.) The results depend on S. Bernstein's work [Izvestiya Akad. Nauk SSSR, Ser. Mat. 14, 381-404 (1950); these Rev. 12, 322] and are expressed in terms of the functions $S_n(x)$ and $C_n(x)$ introduced there.

Theorem. Let T be the class of polynomials $y(x) = \sum p_k x^k$ of degree $\leq n$ with $p'(x) \geq 0$ ($|x| \leq 1$) and satisfying $\sum_{k \leq n} \alpha_k p_k = A$ and $y(-1) = 0$. Then $\inf_{y \in T} [y(1) - y(-1)]$ is attained for a polynomial of the form

$$\int_{-1}^{\alpha} (1-x)^{\alpha} (1+x)^{\beta} U^2(x) dx,$$

where α, β are 0 or 1 and U is a polynomial of degree $(n-1-\alpha-\beta)/2$ whose roots lie in $-1 \leq x \leq 1$. A similar theorem is proved with T replaced by the class of polynomials increasing on the whole real axis and subject to two linear conditions on the coefficients.

TITLE: On the Forms of Multiply-Monotone Extremal Polynomials
(O formakh ekstremal'nykh kratno-monotonnykh polinomov)

PERIODICAL: Doklady Akademii Nauk, 1958, Vol 119, Nr 1, pp 35-37 (USSR)

ABSTRACT: Let $T_n^{(h)}$ be the class of polynomials $y_n(x) \equiv \sum_{k=0}^n p_k x^k$ which on $[-1, +1]$ are multiply-monotone of the order $(h+1)$. A polynomial $y_n^*(x)$ is called extremal on an interval if on the interval it satisfies a condition

$$(1) \quad \omega(y_n) = \sum_{k=0}^n \alpha_k p_k = A$$

and there it has the minimal variation.

Theorem: If the coefficients of the polynomials $y_n(x) \in T_n^{(h)}$ satisfy the condition (1), where $y_n(-1) = 0$ if $\alpha_0 \neq 0$, then among these polynomials there exists a polynomial extremal on $[-1, +1]$ of the form

Card 1/2

On the Forms of Multiply-Monotone Extremal Polynomials 20-119-1-8/52

$$y_n^*(x) = \int_{-1}^x (x-z)^h (1-z)^\alpha (1+z)^\beta U_m^2(z) dz,$$

where $U_m(x)$ is a polynomial of degree $\leq m = \frac{1}{2}(n-1-h-\alpha-\beta)$,

all the roots of which lie on $[-1,+1]$. Here α and β are either 0 or 1 (in dependence of (1)).

Two similar theorems are given for classes of polynomials defined otherwise.

TITLE:

On an Extremal Problem for Some Monotonely Increasing Functions

PERIODICAL:

Ukrainskiy matematicheskiy zhurnal, 1959, Vol 11, Nr 2,
pp 217-220 (USSR)

ABSTRACT:

Let G_{2n} be the class of functions

$$g_{2n}(x) = \int_{-\infty}^x e^{-z^2} y_{2n}(z) dz,$$

where $y_{2n}(x)$ is a polynomial of second degree being ≥ 0 on the whole real axis.

$$L_{g_{2n}} \equiv \int_{-\infty}^{\infty} e^{-z^2} y_{2n}(z) dz$$

is denoted to be the oscillation of the function $g_{2n}(x)$ on the real axis. The authors seek that function $g_{2n}^*(x) \in G_{2n}$ for which the $L_{g_{2n}^*}$ becomes minimal. Furthermore the author discusses

Card 1/2

On an Extremal Problem for Some Monotonely
Increasing Functions

SOV/41-11-2-14/17

the form of the polynomial y_{2n} which corresponds to the extremum.
If the polynomial values $y_{2n}(\xi_k)$ are prescribed in the points ξ_k
and if the ξ_k are roots of a Hermitean polynomial, then for y_{2n}
one obtains a rigorous solution; if the ξ_k are arbitrary numbers,
then only an asymptotic solution ($n \rightarrow \infty$) is reached. In both
cases, among the extremal polynomials there are such which are
rigorous squares of another polynomial.
There are 3 references, 2 of which are Soviet, and 1 German.

TITLE: Conditionally extremal problems in the class of entire functions of finite degree

14, 49, 55

SOURCE: AN SSSR. Doklady, v. 166, no. 2, 1966, 278-280

TOPIC TAGS: complex variable, extremal function

ABSTRACT: The upper and lower bounds are found for the quantity

$$\|\varphi_\sigma\|_{L_p} = \inf_{\varphi_\sigma \in W_\sigma^{+(p)}} \|\varphi_\sigma\|_{L_p} \quad (1)$$

where

$$\|\varphi_\sigma\|_{L_p} = \left(\int_{-\infty}^{\infty} (\varphi_\sigma(x))^p dx \right)^{1/p} < \infty \quad (2)$$

is the norm of the class $W_\sigma^{+(p)}$ ($p \geq 1$) of real entire functions of degree σ which are nonnegative on the real axis. The existence of extremal functions in $W_\sigma^{+(p)}$ subject to linear functional restrictions is shown when there are extremal

TITLE : Sugar Beet in Siberia.
ORIG. PUB. : S. kh. Sibiri, 1958, No. 2, 26-29
ABSTRACT : The state and the prospects of enlarging the sowings of sugar beets in individual oblast's of Siberia. Necessity of the solution of the problem of an efficient distribution of the sowings and the construction of new sugar refineries is pointed out.
